Overview

Theorem (N.-Péroux)

The category of algebras over an *accessible, lax symmetric monoidal* endofunctor on a *locally presentable, symmetric monoidal closed* category is enriched over the category of coalgebras of the same endofunctor.

Examples

There are many examples, including containers[1] with extra structure.

Gain

Get more control over algebras

- Get more "initial algebras" (e.g. W-types)

[1] Recall Stefania Damato's talk

Review of categorical W-types

Let $\mathcal{C}$ be a locally presentable, symmetric monoidal closed category, i.e. Set.

Natural numbers

The type of natural numbers $\mathbb{N}$ is the initial algebra for the endofunctor $X \mapsto X + 1$.

This endofunctor fulfills our hypotheses.

Lists

The type of lists $\mathbb{L}\mathrm{ist}(A)$ is the initial algebra for the endofunctor $X \mapsto X \times A + 1$.

When A is equipped with the structure of a commutative monoid, this fulfills our hypotheses.

Previous work on coalgebraic enrichment

Univeral measuring coalgebra (Wraith, Sweedler 1968)

For k-algebras A and B, there is a coalgebra $\underline{\mathrm{Alg}}(A, B)$

- which underlies an enrichment of algebras in coalgebras
- whose *set-like elements*[2] are in bijection with $\mathrm{Alg}(A, B)$.

Taking $B := k$, one gets the *dual* $\underline{\mathrm{Alg}}(A, k)$ of A.

Extensions

- Anel-Joyal 2013 (dg-algebras)
- Hyland-Franco-Vasilakopoulou 2017 (monoids)
- Vasilakopoulou 2019 ($\mathcal{V}$-categories)
- Péroux 2022 (∞-algebras of an ∞-operad)
- McDermott-Rivas-Uustalu 2022 (monads)
- N-Péroux 2023 (algebras of endofunctor)

[2] those $c \in \underline{\mathrm{Alg}}(A, B)$ s.t. $\Delta c = c \otimes c$ and $\epsilon(c) = 1_A$

Enriched categories[3]

Definition

An *enrichment* of a category $\mathcal{C}$ in a monoidal category $\mathcal{V}$ consists of

- a functor $\underline{\mathcal{C}}(-,-) : \mathcal{C}^{\mathsf{op}} \times \mathcal{C} \to \mathcal{V}$
- a morphism $\mathbb{I} \to \underline{\mathcal{C}}(A, A)$ for each object A of $\mathcal{C}$
- a morphism $\underline{\mathcal{C}}(A, B) \otimes \underline{\mathcal{C}}(B, C) \to \underline{\mathcal{C}}(A, C)$ for each triple A, B, C of objects of $\mathcal{C}$
- an isomorphism $\mathcal{V}(\mathbb{I}, \underline{\mathcal{C}}(A, B)) \cong \mathcal{C}(A, B)$

Remark

Monoidal *closed* means enriched in itself.

[3] Recall Niels van der Weide's talk

Outline

Measuring in general

Fix a category $\mathcal{C}$ and an endofunctor F satisfying our hypotheses.

Measuring

For algebras $(A, \alpha), (B, \beta)$ a *measure* $A \to B$ is a coalgebra (C, χ) together with a morphism $\phi : C \to \underline{\mathcal{C}}(A, B)$ such that

$$\begin{tikzcd}
 & FC \arrow[r, "F(\phi)"] & F(\underline{\mathcal{C}}(A,B)) \arrow[r] & \underline{\mathcal{C}}(FA, FB) \arrow[d, "\beta"] \\
C \arrow[ur, "\chi"] \arrow[r, "\phi"'] & \underline{\mathcal{C}}(A,B) \arrow[rr, "\alpha"] & & \underline{\mathcal{C}}(FA, B)
\end{tikzcd}$$

i.e., the measure and the co/algebra structures are compatible.

The *universal measure* $\underline{\mathrm{Alg}}A, B$ is the terminal measure $A \to B$.

Measuring for the natural numbers

Consider the endofunctor $X \mapsto X + 1$ on Set.

- Algebras are sets A together with $A + 1 \to A$
  - Have $-_A : \mathbb{N} \to A$
- Coalgebras are sets C together with $A \to A + 1$
  - Have $[\![-]\!] : C \to \mathbb{N}^\infty$

Measuring

For algebras A, B, a *measure* $A \to B$ is a coalgebra C together with a function $C \to A \to B$ such that

- $f_c(0_A) = 0_B$ for all $c \in C$;
- $f_c(a + 1) = 0_B$ for all $[\![c]\!] = 0$ and for all $a \in A$;
- $f_c(a + 1) = f_{c-1}(a) + 1$ for $[\![c]\!] \geqslant 1$ and for all $a \in A$.

The *universal measure* $\underline{\mathrm{Alg}} A, B$ is the terminal measure $A \to B$.

Set-like elements in general

Definition

The *set-like elements* are

$$\mathbb{I} \to \underline{\mathsf{Alg}}(A, B)$$

i.e., elements of $\mathsf{Alg}(A, B)$.

Set-like elements for the natural numbers

Set-like elements

The *set-like elements* are

$$\mathbb{I} \to \underline{\mathsf{Alg}}(A, B)$$

Set-like elements for the natural numbers

Set-like elements

The *set-like elements* are

$$\mathbb{I} \to \underline{\mathsf{Alg}}(A, B)$$

where $\mathbb{I}$ has underlying set $\{*\}$ such that $[\![*]\!] = \infty$

Set-like elements for the natural numbers

Set-like elements

The *set-like elements* are

$$\mathbb{I} \to \underline{\mathsf{Alg}}(A, B)$$

where $\mathbb{I}$ has underlying set $\{*\}$ such that $[\![*]\!] = \infty$
so $\mathbb{I} \to \underline{\mathsf{Alg}}(A, B)$ is an element $c \in \underline{\mathsf{Alg}}(A, B)$ s.t. $[\![c]\!] = \infty$

Set-like elements for the natural numbers

Set-like elements

The *set-like elements* are

$$\mathbb{I} \to \underline{\mathrm{Alg}}(A, B)$$

where $\mathbb{I}$ has underlying set $\{*\}$ such that $[\![*]\!] = \infty$
so $\mathbb{I} \to \underline{\mathrm{Alg}}(A, B)$ is an element $c \in \underline{\mathrm{Alg}}(A, B)$ s.t. $[\![c]\!] = \infty$
so f_c is an algebra homomorphism

Measuring

...

- $f_c(0_A) = 0_B$ for all $c \in C$;
- ...
- $f_c(a + 1) = f_{c-1}(a) + 1$ for $[\![c]\!] \geqslant 1$ and for all $a \in A$.

Set-like elements for the natural numbers

Set-like elements

The *set-like elements* are

$$\mathbb{I} \to \underline{\mathrm{Alg}}(A, B)$$

where $\mathbb{I}$ has underlying set $\{*\}$ such that $[\![*]\!] = \infty$
so $\mathbb{I} \to \underline{\mathrm{Alg}}(A, B)$ is an element $c \in \underline{\mathrm{Alg}}(A, B)$ s.t. $[\![c]\!] = \infty$
so f_c is an algebra homomorphism
that is, an element of $\mathrm{Alg}(A, B)$.

Measuring

...

- $f_c(0_A) = 0_B$ for all $c \in C$;
- ...
- $f_c(a + 1) = f_{c-1}(a) + 1$ for $[\![c]\!] \geqslant 1$ and for all $a \in A$.

Set-like elements for the natural numbers

Set-like elements

The *set-like elements* are

$$\mathbb{I} \to \underline{\mathsf{Alg}}(A, B)$$

where $\mathbb{I}$ has underlying set $\{*\}$ such that $[\![*]\!] = \infty$
so $\mathbb{I} \to \underline{\mathsf{Alg}}(A, B)$ is an element $c \in \underline{\mathsf{Alg}}(A, B)$ s.t. $[\![c]\!] = \infty$
so f_c is an algebra homomorphism
that is, an element of $\mathsf{Alg}(A, B)$.

Example

$$\mathsf{Alg}(\mathbb{N}, A) \cong *$$
$$\underline{\mathsf{Alg}}(\mathbb{N}, A) \cong \mathbb{N}^{\infty}$$

What are the non-set-like elements?

Example

$$\mathrm{Alg}(\mathbb{N}, A) \cong *$$
$$\underline{\mathrm{Alg}}(\mathbb{N}, A) \cong \mathbb{N}^\infty$$

The elements corresponding to $n \in \mathbb{N}^\infty$ are functions which 'are algebra homomorphisms' on $\{0, \ldots, n\} \subseteq N$, i.e., are *n-partial homomorphisms*.

- Let $\mathbb{n}$ denote the quotient of $\mathbb{N}$ by $m = n$ for all $m \geqslant n$.
- Let $\mathbb{n}^\circ$ denote the subobject of $\mathbb{N}^\infty$ consisting of $\{0, \ldots, n\}$.

Example

$$\mathrm{Alg}(\mathbb{n}, A) \cong \begin{cases} \mathbb{N}^\infty & \text{if } A_n = A_m \text{ for all } m \geqslant n; \\ \mathbb{n}^\circ & \text{otherwise.} \end{cases}$$

What can we do with this?

Perhaps define more general *initial objects*.

C-initial objects

For a coalgebra C, a *C-initial algebra* is an algebra A universal with the property that for all other algebras B there is a unique

$$C \to \underline{\mathrm{Alg}} A, B.$$

Examples

For the natural-numbers endofunctor:

- $\mathbb{N}$ is the *I-initial algebra*
- $\mathbb{N}$ is the $\mathbb{N}^\infty$*-initial algebra*
- $\mathbb{n}$ is the $\mathbb{n}^\circ$*-initial algebra*

Future work

- Work out more examples in detail
- Understand what it means to endow the containers with extra stucture (e.g. A needs a commutative monoid structure for the container for $\mathbb{L}\mathrm{ist}(A)$)
- Understand C-initial algebras in more examples and in general
- Understand if this extra structure is useful for programming languages

Thank you!
